

Orion nCompass MC version V1.2.0 release notes/updates 04-15-2016

1. Corrected error in program entry event assignment. Program event control assignments now based on output configuration of selected primary loop.
2. Corrected text of program entry "Event" button so the "asterisk" indicating events are programmed for the step will only show for program event selections matching the event output configuration of the selected primary loop.
3. Assembly versions updated to 1.2.0.

Orion nCompass MC version V1.1.0 release notes/updates 09-22-2015

4. Profile start modified (in profile edit area) so profiles can not be started on a jump step or step with soak and holdback enabled. This corrects high output condition when program is started on a step where setpoint is a negative value + soak active + holdback active.
5. Profile start screen displays step info under "start" button to user. This allows user to see step type before starting a profile.
6. Profile reset value (26660) sent to profile on each start when profile started from step other than step 1. This resets profile end bit at board level.
7. Numeric keypad bug corrected to allow values of :01 to :09 for entry during profile time entry.
8. Bitmaps for all On/Off button objects set during screen load. This corrects issue with "off" state not being displayed in some cases.

Orion nCompass MC version V1.0.0 release notes/updates 03-12-2015

1. New release based on nCompass LC version 1.9.4. MC version provides up to 10 loops of control with independent or master/slave setpoint program operation.
